

## User Manual Transport System:

Hello and welcome to our amazing Transport System.

This system is used to manage all transport operations and transport documents.

When you enter the system you encounter the first menu and these choices:

- 1.Edit Resources – as the name implies, this section will be used to edit all resources in your system (adding/removing trucks, sites and supplies) excluding drivers, which will be managed from the Employees System.
- 2.Orders – this is where the main functionality of the system will reside, more information below.

Orders Section includes :

### 1.Edit Documents –

- 1.1. Change the quantity of the order in your document.
- 1.2. Set Current Weight – as you asked for in your requirements, you enter the current weight the driver has told you before he left the supplier.  
If the weight exceeds the trucks weight limit an error will pop up and a menu will appear.  
The options incase of an overweight Truck are :
  - A) changing a truck.
  - B) removing or replacing destinations.
  - C) removing supplies from the overweight order.

After each option you will be asked to enter the weight again until the weight doesn't exceed the limit.

- 1.3. Delete Document – as the name implies you can delete a document.

**\*Take note that all corresponding information will be lost after deleting the document, meaning Driver Documents regarding this document will also be lost.**

- 1.4. Transport Finished – classifying the Transport as finished.
- 1.5. Remove Store From Doc – remove stores listed in the Transport doc manually.

### 2.View Order – after entering an order ID you will be shown all information for that document.

3.Create New Order – Creating a new order from available drivers, trucks.  
if there are not trucks or drivers available you wont be able to create the Transport order.

4. Show Driver Docs – As you requested there is a document for the driver, listing the destination and the supplies ordered from said destination. You can print it on your HP printer.
